

## Velocity Template Syntax

Email Notifiers use Velocity templates to render email content. Consult the [Velocity User Guide](#) for specific details on syntax.

## Available Variables

### Person Data

- `${FIRST_NAME}`
- `${LAST_NAME}`
- `${EMAIL}`

### Request Metadata

#### Hosted Applications

- `#{token}` - the user's unique verification token
- `#{verifyUrl}` - the fully-qualified URL of the verification app that this user used (example: `https://birdiesforthebrave.sheerid.com/ThePlayers/ActiveRetired/`)
- *Any defined field name from `extraFields` template configuration*

#### API Integrations

- *Any metadata which is explicitly sent with the initial verification request*

#### Reward Data

- *Conditional based on the template/request configuration. (example: `#{coupon}` if there is a Reward configured to assign a coupon code to the coupon reward data key)*

#### Other

- `#{errorblock}` - an HTML unordered list containing zero or more errors that accompany the current `VerificationResponse` (example: reason for document review failure)

## Common conventions

### Upload URL

Constructing a URL to offer a user-specific link to upload additional documentation (provided request came from a hosted verification app):

```
#{verifyUrl}upload.html?token=#{token}
```
